Chapter 1

Introduction

1.1 About

Congratulations on choosing XIMC multi-platform programming library! This document contains all information about XIMC library. It utilizes well known virtual COM-port interface, so you can use it on Windows 7, Windows Vista, Windows XP, Windows Server 2003, Windows 2000, Linux, Mac OS X. XIMC multi-platform programming library supports plug/unplug on the fly. One program can control one device. Multiple processes (programs) that control one device simultaneously are not allowed.

1.2 System requirements

1.2.1 For rebuilding library

On Windows:

- Windows 2000 or later, 64-bit system (if compiling both architectures) or 32-bit system.
- Microsoft Visual C++ 2008 or later
- cygwin with tar, bison, flex installed

On Linux or FreeBSD:

- 64-bit or/and 32-bit system
- gcc 4 or later
- common autotools: autoconf, autoheader, aclocal, automake, autoreconf, libtool
- gmake
- doxygen - for building docs
- LaTeX distribution (TeX or TeXlive) - for building docs
- flex 2.5.30+
- bison
- mercurial (for building developer version from hg)

On Mac OS X:

- XCode 4

- doxygen
- mactex
- autotools
- mercurial (for building developer version from hg)

If mercurial is used, please enable 'purge' extension by adding to `~/.hgrc` following lines:

```
[extensions]
hgext.purge=
```

1.2.2 For using library

Supported operating systems (32 or 64 bit):

- Mac OS X: XCode 4

Chapter 2

How to rebuild library

2.1 Building on generic UNIX

Generic version could be built with standard autotools.

```
./build.sh lib
```

Built files (library, headers, documentation) are installed to `./dist/local` directory. It is a generic developer build. Sometimes you need to specify additional parameters to command line for your machine. Please look to following OS sections.

2.2 Building on debian-based linux systems

Requirement: 64-bit and 32-bit debian system, ubuntu Typical set of packages: gcc, autotools, autoconf, libtool, dpkg-dev, flex, bison, doxygen, texlive, mercurial Full set of packages: debhelper g++ mercurial make autotools-dev automake autoconf libtool default-jre-headless default-jdk openjdk-6-jdk dpkg-dev lintian texlive texlive-latex-extra texlive-lang-cyrillic dh-autoreconf hardening-wrapper bison flex doxygen lsb-release For ARM cross-compiling install gcc-arm-linux-gnueabi from your ARM toolchain.

It's required to match library and host architecture: 64-bit library can be built only at 64-bit host, 32-bit library - only at 32-bit host. ARM library is built with armhf cross-compiler gcc-arm-linux-gnueabi.

To build library and package invoke a script:

```
$ ./build.sh libdeb
```

For ARM library replace 'libdeb' with 'libdebarm'.

Grab packages from `./ximc/deb` and locally installed binaries from `./dist/local`.

2.3 Building on redhat-based linux systems

Requirement: 64-bit redhat-based system (Fedora, Red Hat, SUSE) Typical set of packages: gcc, autotools, autoconf, libtool, flex, bison, doxygen, texlive, mercurial Full set of packages: autoconf automake bison doxygen flex gcc gcc-32bit gcc-c++ gcc-c++-32bit java-1.7.0-openjdk java-1.7.0-openjdk-devel libtool lsb-release make mercurial rpm-build rpm-devel rpmlint texlive texlive-fonts-extra texlive-latex

It's possible to build both 32- and 64-bit libraries on 64-bit host system. 64-bit library can't be built on 32-bit system.

To build library and package invoke a script:

```
$ ./build.sh librpm
```

Grab packages from `./ximc/rpm` and locally installed binaries from `./dist/local`.

2.4 Building on FreeBSD

Requirement: 64-bit or 32-bit FreeBSD Typical set of packages: gcc, autotools, autoconf, libtool, flex, bison, doxygen, teTeX, mercurial

It's required to match library and host architecture. Also you need to fix a `configure.ac` to exclude SOVER from the package name (freebsd does not use linux conventions on library versioning).

To build a library and package invoke following command. It requires sudo privileges for port installing and specially crafted `/usr/ports/local` tree. Consult a script for details.

```
$ ./build.sh libfreebsd
```

Grab packages from `./ximc/freebsd`.

2.5 Building on Mac OS X

To build and package a script invoke a script:

```
$ ./build.sh libosx
```

Built library (classical and framework), examples (classical and `.app`), documentation are located at `./ximc/macosx`, locally installed binaries from `./dist/local`.

2.6 Building on Windows

Requirements: 64-bit windows (build script builds both architectures), cygwin (must be installed to a default path), mercurial.

Invoke a script:

```
$ ./build.bat
```

Grab packages from `./deb/win32` and `./deb/win64`

To build debug version of the library set environment variable "DEBUG" to "true" before running the build script.

2.7 Source code access

XIMC source codes are given under special request.

Chapter 3

How to use with...

Library usage can be examined from test application testapp. Non-C languages are supported because library supports stdcall calling convention and so can be used with a variety of languages.

C test project is located at 'examples/testapp' directory, C# test project - at 'examples/testcs', VB.NET - 'examples/testvbnet', Delphi 6 - 'examples/testdelphi', sample bindings for MATLAB - 'examples/testmatlab'

NOTE: SDK requires Microsoft Visual C++ Redistributable Package 9.0.307291 (provided with SDK - vc_redist.x86 or vc_redist.x64)

3.1 Usage with C

3.1.1 Visual C++

Testapp can be built using testapp.sln. Library must be compiled with MS Visual C++ too, mingw-library isn't supported. Make sure that Microsoft Visual C++ Redistributable Package is installed.

Open solution examples/testapp/testapp.sln, build and run from the IDE.

3.1.2 MinGW

MinGW is a port of GCC to win32 platform. It's required to install MinGW package. Currently not supported

MinGW-compiled testapp can be built with MS Visual C++ or mingw library.

```
$ mingw32-make -f Makefile.mingw all
```

Then copy library libximc.dll to current directory and launch testapp.exe.

3.1.3 C++ Builder

First of all you should create C++ Builder-style import library. Visual C++ library is not compatible with BCB. Invoke:

```
$ implib libximc.lib libximc.def
```

Then compile test application:

```
$ bcc32 -I..\..\ximc\win32 -L..\..\ximc\win32 -DWIN32 -DNDEBUG -DWINDOWS  
testapp.c libximc.lib
```

3.1.4 XCode

Test app should be built with XCode project testapp.xcodeproj. Library is a Mac OS X framework, and at example application it's bundled inside testapp.app

Then launch application testapp.app and check activity output in Console.app.

3.1.5 GCC

Make sure that libximc (rpm, deb, freebsd package or tarball) is installed at your system. Installation of package should be performed with a package manager of operating system. On OS X plain dylib library and a framework is provided.

Note that user should belong to system group which allows access to a serial port (dip or serial, for example).

Test application can be built with the installed library with the following script:

```
$ make
```

In case of cross-compilation (target architecture differs from the current system architecture) feed -m64 or -m32 flag to compiler. On OS X it's needed to use -arch flag instead to build an universal binary. Please consult a compiler documentation.

Then launch the application as:

```
$ make run
```

Note: make run on OS X copies a library to the current directory. If you want to use library from the custom directory please be sure to specify LD_LIBRARY_PATH or DYLD_LIBRARY_PATH to the directory with the library.

3.2 .NET

Wrapper assembly for libximc.dll is wrappers/csharp/ximcnet.dll. It is provided with two different architectures and depends on .NET 2.0.

Test .NET applications for Visual Studio 2008 is located at testcs (for C#) and testvbnet (for VB.NET) respectively. Open solutions, build and run.

3.3 Delphi

Wrapper for libximc.dll is a unit wrappers/delphi/ximc.pas

Console test application for is located at testdelphi. Tested with Delphi 6 and only 32-bit version.

Just compile, place DLL near the executable and run program.

3.4 MATLAB

Sample MATLAB program testximc.m is provided at the directory examples/testmatlab. Change current directory to the examples/matlab and copy [ximc.h](#), libximc.dll, bindy.dll, xiwrapper.dll to the current directory. If you have 64-bit matlab, you must additionally copy libximc.thunk.pwin64.dll and ximc.m to the current directory. With 32-bit matlab launch

```
testximc32.m
```

With 64-bit matlab launch

testximc64.m

They differs only with library loading instructions.

3.5 Generic logging facility

If you want to turn on file logging, you should run the program that uses libximc library with the "XILOG" environment variable set to desired file name. This file will be opened for writing on the first log event and will be closed when the program which uses libximc terminates. Data which is sent to/received from the controller is logged along with port open and close events.

Data Fields

- unsigned int [CTPMinError](#)
Minimum contrast steps from step motor encoder position, wich set STATE_CTP_ERROR flag.
- unsigned int [CTPFlags](#)
Position control flags.

4.11.1 Detailed Description

Control position settings(is only used with stepper motor).

When controlling the step motor with encoder (CTP_BASE 0) it is possible to detect the loss of steps. The controller knows the number of steps per revolution (GENG :: StepsPerRev) and the encoder resolution (GFBS :: IPT). When the control (flag CTP_ENABLED), the controller stores the current position in the footsteps of SM and the current position of the encoder. Further, at each step of the position encoder is converted into steps and if the difference is greater CTPMinError, a flag STATE_CTP_ERROR and set ALARM state. When controlling the step motor with speed sensor (CTP_BASE 1), the position is controlled by him. The active edge of input clock controller stores the current value of steps. Further, at each turn checks how many steps shifted. When a mismatch CTPMinError a flag STATE_CTP_ERROR and set ALARM state.

- unsigned int [DeadZone](#)

- unsigned int [JoyFlags](#)

4.34.1 Detailed Description

Joystick settings.

This structure contains joystick parameters. If joystick position is outside DeadZone limits from the central position a movement with speed, defined by the joystick DeadZone edge to 100% deviation, begins. Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy.

If next

speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The DeadZone ranges are illustrated on the following picture.  The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy. The following picture illustrates this:  The nonlinearity parameter is adjustable. Setting it to zero makes deviation/speed relation linear.

Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The DeadZone ranges are illustrated on the following picture.  The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy. The following picture illustrates this:  The nonlinearity parameter is adjustable. Setting it to zero makes deviation/speed relation linear.
