Chapter 1

Introduction

1.1 About

Congratulations on choosing XIMC multi-platform programming library! This document contains all information about XIMC library. It utilizes well known virtual COM-port interface, so you can use it on Windows 7, Windows Vista, Windows XP, Windows Server 2003, Windows 2000, Linux, Mac OS X. XIMC multi-platform programing library supports plug/unplug on the fly. Each device can be controlled only by one program at once. Multiple processes (programs) that control one device simultaneously are not allowed.

1.2 System requirements

1.2.1 For rebuilding library

On Windows:

- Windows 2000 or later, 64-bit system (if compiling both architectures) or 32-bit system.
- Microsoft Visual C++ 2013 or later
- cygwin with tar, bison, flex, curl installed
- 7z

On Linux:

- 64-bit or/and 32-bit system system
- gcc 4 or later

On Mac OS X:

- XCode 4
- doxygen
- mactex
- autotools
- mercurial (for building developer version from hg)

If mercurial is used, please enable 'purge' extension by adding to `~/.hgrc` following lines:

```
[extensions]
hgext.purge=
```

Chapter 2

How to rebuild library

2.1 Building on generic UNIX

Generic version could be built with standard autotools.

```
./build.sh lib
```

Built files (library, headers, documentation) are installed to ./dist/local directory. It is a generic developer build. Sometimes you need to specify additional parameters to command line for your machine. Please look to following OS sections.

2.2 Building on debian-based linux systems

Requirement: 64-bit and 32-bit debian system, ubuntu Typical set of packages: gcc, autotools, autoconf, libtool, dpkg-dev, flex, bison, doxygen, texlive, mercurial Full set of packages: apt-get install ruby1.9.1 debhelper vim sudo g++ mercurial git curl make cmake autotools-dev automake autoconf libtool default-jre-headless default-jdk openjdk-6-jdk dpkg-dev lintian texlive texlive-latex-extra texlive-lang-cyrillic dh-autoreconf hardening-wrapper bison flex doxygen lsb-release pkg-config check For ARM cross-compiling install gcc-arm-linux-gnueabihf from your ARM toolchain.

It's required to match library and host architecture: 64-bit library can be built only at 64-bit host, 32-bit library - only at 32-bit host. ARM library is built with armhf cross-compiler gcc-arm-linux-gnueabihf.

To build library and package invoke a script:

```
$ ./build.sh libdeb
```

For ARM library replace 'libdeb' with 'libdebarm'.

Grab packages from ./ximc/deb and locally installed binaries from ./dist/local.

2.3 Building on redhat-based linux systems

Requirement: 64-bit redhat-based system (Fedora, Red Hat, SUSE) Typical set of packages: gcc, autotools, autoconf, libtool, flex, bison, doxygen, texlive, mercurial Full set of packages: autoconf automake bison doxygen flex gcc gcc-32bit gcc-c++ gcc-c++-32bit java-1_7_0-openjdk java-1_7_0-openjdk-devel libtool lsb-release make mercurial rpm-build rpm-devel rpmlint texlive texlive-fonts-extra texlive-latex

It's possible to build both 32- and 64-bit libraries on 64-bit host system. 64-bit library can't be built on 32-bit system.

To build library and package invoke a script:

```
$ ./build.sh librpm
```

Grab packages from ./ximc/rpm and locally installed binaries from ./dist/local.

2.4 Buliding on Mac OS X

To build and package a script invoke a script:

```
$ ./build.sh libosx
```

Built library (classical and framework), examples (classical and .app), documentation are located at ./ximc/macosx, locally installed binaries from ./dist/local.

2.5 Buliding on Windows

Requirements: 64-bit windows (build script builds both architectures), cygwin (must be installed to a default path), mercurial.

Invoke a script:

```
$ ./build.bat
```

Grab packages from ./deb/win32 and ./deb/win64

To build debug version of the library set environment variable "DEBUG" to "true" before running the build script.

2.6 Source code access

XIMC source codes are given under special request.

Chapter 3

How to use with...

Library usage can be examined from test application testapp. Non-C languages are supported because library supports stdcall calling convention and so can be used with a variety of languages.

C test project is located at 'examples/testapp' directory, C# test project - at 'examples/testcs', VB.NET - 'examples/testvbnet', Delphi 6 - 'examples/testdelphi', sample bindings for MATLAB - 'examples/testmatlab', for Java - 'examples/testjava', for Python - 'examples/testpython'. Development kit also contains precompiled examples: testapp and testappeasy as 32 and 64-bit applications for Windows and 64-bit application for osx, testcs, testvbnet, testdelphi - 32-bit only, testjava is architecture-independent, testmatlab and testpython are runtime-interpreted.

NOTE: SDK requires Microsoft Visual C++ Redistributable Package (provided with SDK - vcredist_x86 or vcredist_x64)

3.1 Usage with C

3.1.1 Visual C++

Testapp can be built using testapp.sln. Library must be compiled with MS Visual C++ too, mingw-library isn't supported. Make sure that Microsoft Visual C++ Redistributable Package is installed.

Open solution examples/testapp/testapp.sln, build and run from the IDE.

3.1.2 MinGW

MinGW is a port of GCC to win32 platform. It's required to install MinGW package. Currently not supported

MinGW-compiled testapp can be built with MS Visual C++ or mingw library.

```
$ mingw32-make -f Makefile.mingw all
```

Then copy library libximc.dll to current directory and launch testapp.exe.

3.1.3 C++ Builder

First of all you should create C++ Builder-style import library. Visual C++ library is not compatible with BCB. Invoke:

```
$ implib libximc.lib libximc.def
```

Then compile test application:

```
$ bcc32 -I..\\..\\ximc\\win32 -L..\\..\\ximc\\win32 -DWIN32 -DNDEBUG -D_WINDOWS  
testapp.c libximc.lib
```

3.1.4 XCode

Test app should be built with XCode project testapp.xcodeproj. Library is a Mac OS X framework, and at example application it's bundled inside testapp.app

Then launch application testapp.app and check activity output in Console.app.

3.1.5 GCC

Make sure that libximc (rpm, deb, freebsd package or tarball) is installed at your system. Installation of package should be performed with a package manager of operating system. On OS X a framework is provided.

Note that user should belong to system group which allows access to a serial port (dip or serial, for example).

Test application can be built with the installed library with the following script:

```
$ make
```

In case of cross-compilation (target architecture differs from the current system architecture) feed -m64 or -m32 flag to compiler. On OS X it's needed to use -arch flag instead to build an universal binary. Please consult a compiler documentation.

Then launch the application as:

```
$ make run
```

Note: make run on OS X copies a library to the current directory. If you want to use library from the custom directory please be sure to specify LD_LIBRARY_PATH or DYLD_LIBRARY_PATH to the directory with the library.

3.2 .NET

Wrapper assembly for libximc.dll is wrappers/csharp/ximcnet.dll. It is provided with two different architectures and depends on .NET 2.0.

Test .NET applications for Visual Studio 2013 is located at testcs (for C#) and testvbnet (for VB.NET) respectively. Copy ximcnet.dll, libximc.dll, xiwrapper.dll, bindy.dll from the ximc-2.x.x/ximc/win64 or ximc-2.x.x/ximc/win32 accordingly to your system to the current directory. Open solutions, build and run.

3.3 Delphi

Wrapper for libximc.dll is a unit wrappers/delphi/ximc.pas

Console test application for is located at testdelphi. Tested with Delphi 6 and only 32-bit version.

Just compile, place DLL near the executable and run program.

3.4 Java

How to run example on Linux. Navigate to ximc-2.x.x./examples/testjava/compiled/ and run:

```
$ java -classpath /usr/share/java/libjximc.jar -classpath testjava.jar ru.ximc.  
TestJava
```

How to run example on Windows or Mac. Navigate to ximc-2.x.x./examples/testjava/compiled/. Copy contents of ximc-2.x.x/ximc/win64 or ximc-2.x.x/ximc/macosx accordingly to the current directory. Then run:

```
$ java -classpath libjximc.jar -classpath testjava.jar ru.ximc.TestJava
```

How to modify and recompile an example. Navigate to examples/testjava/compiled. Sources are embedded in a testjava.jar. Extract them:

```
$ jar xvf testjava.jar ru META-INF
```

Then rebuild sources:

```
$ javac -classpath /usr/share/java/libjximc.jar -Xlint ru/ximc/TestJava.java
```

or for windows or mac

```
$ javac -classpath libjximc.jar -Xlint ru/ximc/TestJava.java
```

Then build a jar:

```
$ jar cmf META-INF/MANIFEST.MF testjava.jar ru
```

3.5 Python

1. Change current directory to the examples/python.
1. On OS X copy library ximc/macosx/libximc.framework to the current directory. On Windows copy libraries from ximc/win32 or ximc/win64 to the current directory. Note: the Python architecture you are using to run the example (32/64 bit) must match that of Windows and libximc.
1. Copy contents of ximc/crossplatform/wrappers/python/ to the current directory or just set env variable PYTHONPATH:

```
export PYTHONPATH=$PYTHONPATH:'pwd'../../ximc/crossplatform/wrappers/python
```

1. On Linux you may need to set LD_LIBRARY_PATH so Python can locate libraries with RPATH. For example, you may need:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:'pwd'
```

1. Then launch Python 2 or Python 3:

```
python testpython.py
```

3.6 MATLAB

Sample MATLAB program testximc.m is provided at the directory examples/testmatlab. Change current directory to the examples/matlab. On windows copy [ximc.h](#), libximc.dll, bindy.dll, xiwrapper.dll and contents of ximc/(win32,win64)/wrappers/matlab/ directory to the current directory.

On Mac install Apple's "Command Line Tools for XCode" and then copy ximc/macosx/libximc.framework and contents of ximc/macosx/wrappers/matlab to the the current directory.

Then launch in MATLAB prompt:

```
testximc
```

3.7 Generic logging facility

If you want to turn on file logging, you should run the program that uses libximc library with the "XILOG" environment variable set to desired file name. This file will be opened for writing on the first log event and will be closed when the program which uses libximc terminates. Data which is sent to/received from the controller is logged along with port open and close events.

3.8 Required permissions

libximc generally does not require special permissions to work, it only needs read/write access to USB-serial ports on the system. An exception to this rule is a Windows-only "fix_usbser.sys()" function - it needs elevation and will produce null result if run as a regular user.

Data Fields

- unsigned int [CTPMinError](#)
Minimum contrast steps from step motor encoder position, which set STATE_CTP_ERROR flag.
- unsigned int [CTPFlags](#)
Position control flags.

4.11.1 Detailed Description

Control position settings(is only used with stepper motor).

When controlling the step motor with encoder (CTP_BASE 0) it is possible to detect the loss of steps. The controller knows the number of steps per revolution (GENG :: StepsPerRev) and the encoder resolution (GFBS :: IPT). When the control (flag CTP_ENABLED), the controller stores the current position in the footsteps of SM and the current position of the encoder. Further, at each step of the position encoder is converted into steps and if the difference is greater CTPMinError, a flag STATE_CTP_ERROR and set ALARM state. When controlling the step motor with speed sensor (CTP_BASE 1), the position is controlled by him. The active edge of input clock controller stores the current value of steps. Further, at each turn checks how many steps shifted. When a mismatch CTPMinError a flag STATE_CTP_ERROR and set ALARM state.

- unsigned int **DeadZone**

4.34.1 Detailed Description

Joystick settings.

This structure contains joystick parameters. If joystick position is outside DeadZone limits from the central position a movement with speed, defined by the joystick DeadZone edge to 100% deviation, begins. Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy.

Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The DeadZone ranges are illustrated on the following picture. !/attachments/download/5563/range25p.png! The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy. The following picture illustrates this: !/attachments/download/3092/ExpJoystick.png! The nonlinearity parameter is adjustable. Setting it to zero makes deviation/speed relation linear.
